## PROBLEM:

This problem is concerned with finding the output of an FIR filter for a given input signal. A linear timeinvariant system is described by the difference equation

$$
y[n]=\sum_{k=0}^{4}(5-k) x[n-k]
$$

(a) Determine the filter coefficients $\left\{b_{k}\right\}$ of this FIR filter.
(b) Find the impulse response, $h[n]$, for this FIR filter. The impulse response is a discrete-time signal, so make a (stem) plot of $h[n]$ versus $n$.
(c) Use the above difference equation to compute the output $y[n]$ when the input is

$$
x[n]= \begin{cases}0 & n<0 \\ 10 & 0 \leq n \leq 5 \\ 1 & 6 \leq n \leq 10 \\ 0 & n \geq 11\end{cases}
$$

Make a plot of both $x[n]$ and $y[n]$ vs. $n$. (Hint: you might find it useful to check your results with Matlab's conv () function.)
(a) $\frac{h}{0} \frac{5-h}{5}$
$\left[b_{k}\right]=\left[\begin{array}{lllll}5 & 4 & 3 & 2 & 1\end{array}\right]$
