

Local Anesthetic Procedure

- The Spermatic cord of each testicle was palpated and isolated laterally and lightly compressed against the scrotum
- Using a 5ml syringe of 2% lidocaine and 22G needle, 3ml of lidocaine directly into the spermatic cord. The remaining 2mls is injected into the subcutaneous space surround the spermatic cord.
- The above procedures are repeated for the second testicle
- Allow 10 minutes to pass to achieve maximum efficacy for surgical grade anesthesia
