

Post Operative Care

- Ensure the area has been treated with an antiseptic ointment.
- Clean the abscess area every 1-2 days with a drying agent like Kopertox for 7 to 10 days. Apply Kopertox with a swab or brush.
- Prevent dirty, wet and rough ground conditions.

Why is bandaging with wraps not practised?

- Dealing with cattle, the wrap can easily become soaked or contaminated with urine or manure.
- Seeing as the procedure does not involve stitching of the area, the open wound would easily become re-infected.
